$L_c=?$

# Polynomial and $L_c$

$$x^4 + x^3 + 1$$

$$x^4 + x^2 + 1$$

Larger  $L_c$  , Better TPG

# Primitive Polynomial

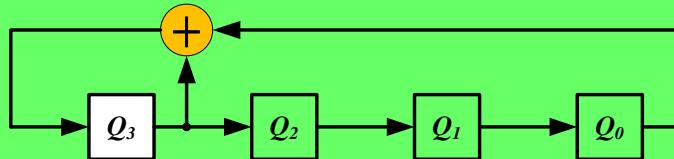

- **Primitive polynomial (PP) generates maximum-length sequence**
  - ◆  $L_c = 2^N - 1$ ,  $N$ =degree of PP
- PP NOT unique for a given  $N$ 
  - ◆  $1+x+x^4$ ,  $1+x^3+x^4$  are both PP
- PP of degree  $N$  must satisfy:
  - ◆ PP is *irreducible*
  - ◆ PP has odd number of terms
  - ◆ PP divides  $1+x^{2^N-1}$  ; $N>3$
  - ◆ more details see (BMS 87)
- PP can be found by *Seive Method*
  - ◆ Many available on line

$N$	primitive polynomial $f(X)$
1,2,3,4,6,7,15,22	$1 + X + X^N$
5,11,21,29	$1 + X^2 + X^N$
10,17,20,25,28,31	$1 + X^3 + X^N$
9	$1 + X^4 + X^N$
23	$1 + X^5 + X^N$
18	$1 + X^7 + X^N$
8	$1 + X^2 + X^3 + X^4 + X^N$
12	$1 + X + X^2 + X^4 + X^N$
13	$1 + X + X^3 + X^4 + X^N$
14,16	$1 + X^3 + X^4 + X^5 + X^N$
19,27	$1 + X + X^2 + X^5 + X^N$
24	$1 + X + X^2 + X^7 + X^N$
26	$1 + X + X^2 + X^6 + X^N$
30	$1 + X + X^2 + X^{23} + X^N$
32	$1 + X + X^2 + X^{22} + X^N$

PP Often Used to Design TPG

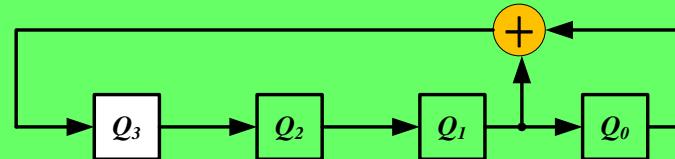

# Quiz

Q: Compare two PP  $x^4+x^3+1, x^4+x+1$ . Fill in table.  $L_c=?$

state	$Q_3$	$Q_2$	$Q_1$	$Q_0$
0	1	0	0	0
1	1	1	0	0
2	1	1	1	0

$L_c=?$

# *m-Sequence*

- A sequence generated by *primitive polynomial LFSR* is called
  - ◆ *Maximum-length sequence (m-sequence)*
  - ◆ aka. *pseudorandom sequence, pseudonoise sequence*
- m-sequence has period  $L_c=2^N-1$
- Example:  $N=4$ 
  - ◆  $x^4+x^3+1$
  - ◆ Period  $L_c = 15$

*m-sequence*=**000111101011001**  
(left bit first)

state	$Q_3$	$Q_2$	$Q_1$	$Q_0$
0	1	0	0	0
1	1	1	0	0
2	1	1	1	0
3	1	1	1	1
4	0	1	1	1
5	1	0	1	1
6	0	1	0	1
7	1	0	1	0
8	1	1	0	1
9	0	1	1	0
10	0	0	1	1
11	1	0	0	1
12	0	1	0	0
13	0	0	1	0
14	0	0	0	1

m-sequence

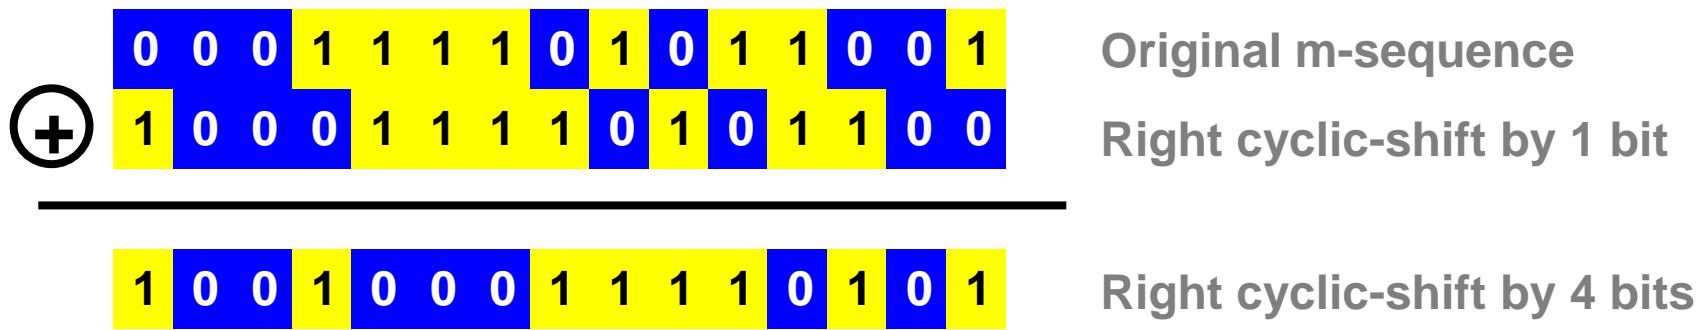

# Properties of m-Sequence (1)

- 1. Period  $L_c = 2^N - 1$ 
  - ◆ Example:  $x^4 + x^3 + 1$ ,  $N=4$
  - ◆ 000111101011001
  - ◆  $L_c = 15$
- 2.  $2^{N-1}$  ones and  $2^{N-1} - 1$  zeros (almost equal probability)
  - ◆ Example:
  - ◆ 8 ones, 7 zeros
- 3. If a window of width  $N$  is slid along m-sequence, each of  $2^{N-1}$  non-zero  $N$ -tuple is seen exactly once in a period

0	0	0	1	1	1	1	0	1	0	1	1	0	0	1	0	0	0
0	0	0	1														
	0	0	1	1													
		0	1	1	1												
			1	1	1	1											
				1	1	1	0										
					1	1	0	1									
						1	0	1	0								
							0	1	0	1							
								1	0	1	1						
									0	1	1	0					
										1	1	0	0				
											1	0	0	1			
												0	0	1	0		
												0	1	0	0		
													1	0	0	0	

# Properties of m-Sequence (2)

- 4. m-sequence + its *cyclic shift* = another cyclic shift of itself
  - cyclic-shift-and-add property*
  - This property is useful for *phase shifter* (see BIST-2 chapter)
  - Example: m-sequence of  $x^4+x^3+1$ ,  $N=4$ 
    - \* NOTE: mod-2 add = XOR

- See *finite field theory* or (BMS 87) for more properties

m-sequence Has Nice Properties

# Quiz

Q: Given another m-sequence **000100110101111** generated by PP  $x^4+x+1$ .

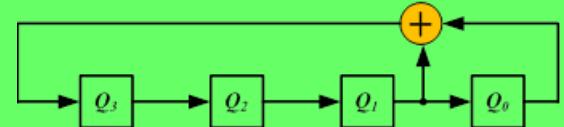

Show that it also satisfies properties:

- 1)  $L_c=15$
- 2) 8 ones and 7 zeros
- 3) it has cyclic-shift-add property

original + left-shift-by-2-bit = left-shift-by-?-bit

A:

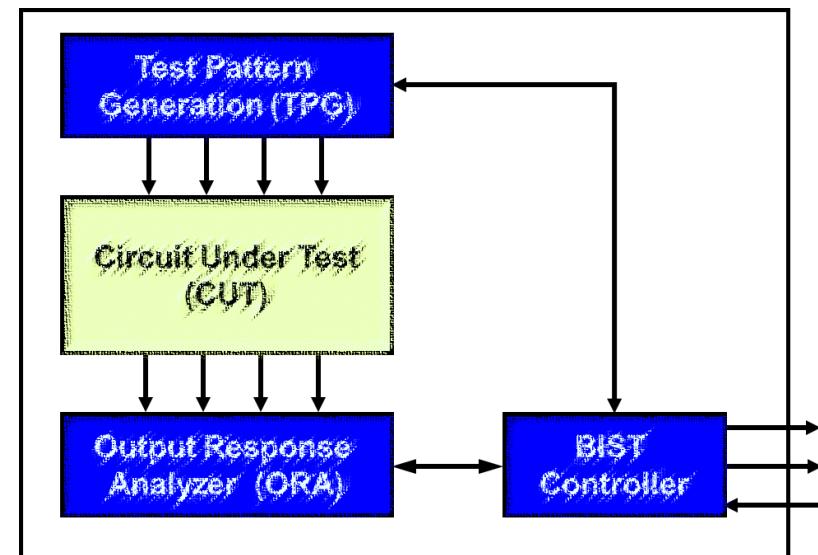

$$\begin{array}{r} \textcircled{+} \\ \begin{array}{r} 0\ 0\ 0\ 1\ 0\ 0\ 1\ 1\ 0\ 1\ 0\ 1\ 1\ 1\ 1\ 1 \\ 0\ 1\ 0\ 0\ 1\ 1\ 0\ 1\ 0\ 1\ 1\ 1\ 1\ 0\ 0 \end{array} \\ \hline \end{array}$$

	Q <sub>3</sub>	Q <sub>2</sub>	Q <sub>1</sub>	Q <sub>0</sub>
0	1	0	0	0
1	0	1	0	0
2	0	0	1	0

      - Design of LFSR
        - ⇒ How to find seed?
        - ⇒ What polynomial?
        - ⇒ All-zero pattern?
        - ⇒ What is LFSR degree?
    - \* Cellular Automata, CA (1984)

# State Diagram

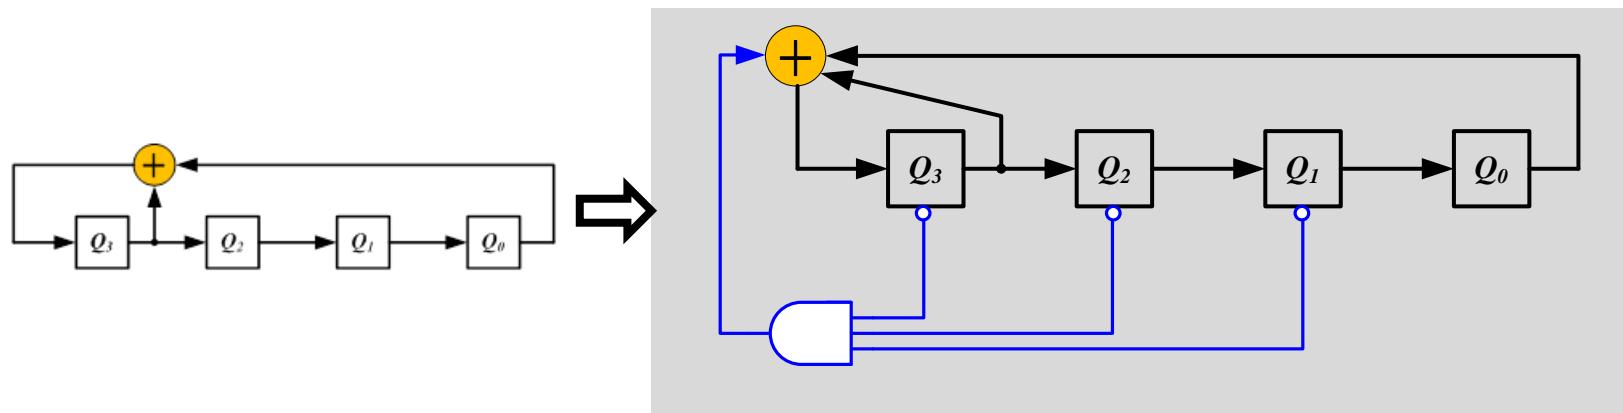

$$f(x) = x^4 + x^3 + 1$$

# What if we want all-zero in cycle?

# Exhaustive Feedback Shift Register

- Exhaustive feedback Shift Register (aka. *De Bruijn Counter*)
  - ◆  $2^N$  different states
- Example:  $N=4$ ; 16 exhaustive states
  - ◆  $0001 \rightarrow \underline{0000} \rightarrow 1000$

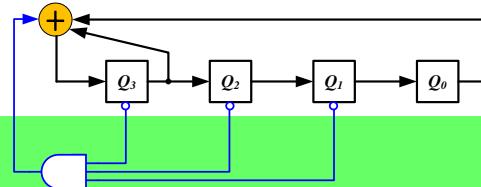

- NOTE: This is NOT LFSR because AND is nonlinear

DB Counter Generates All-zero Patterns

# Quiz

Q: Show this DB counter generates all 16 states.  
Fill in table.

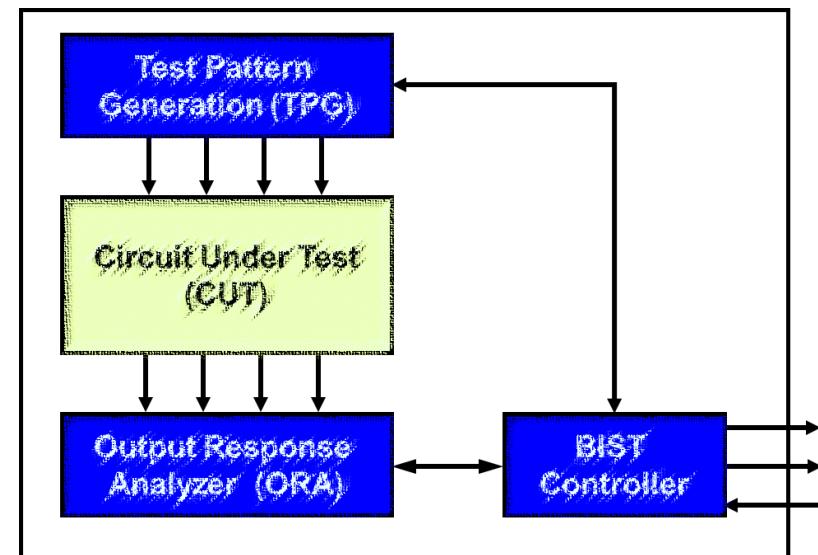

state	Q <sub>3</sub>	Q <sub>2</sub>	Q <sub>1</sub>	Q <sub>0</sub>

# BIST Part1 - TPG

- Introduction
- Test Pattern Generation (TPG)
  - ◆ Deterministic: ROM, Algorithm, Counter
  - ◆ Pseudo Random
    - \* Linear Feedback Shift Register, LFSR (1977)
      - Two types of LFSR
      - Design of LFSR
        - ⇒ How to find seed?
        - ⇒ What polynomial?
        - ⇒ All-zero pattern?
        - ⇒ What is LFSR degree?
    - \* Cellular Automata, CA (1984)

# What is LFSR Degree?

[Konemann 91] \*not in exam

- Suppose  $N$ -degree LFSR,  $S$  care bits (i.e. specified bits)
  - ◆  $N$  variables,  $S$  equations
  - ◆ What is minimum  $N$  to guarantee a solution (seed) can be found?
- Probability of not finding a solution

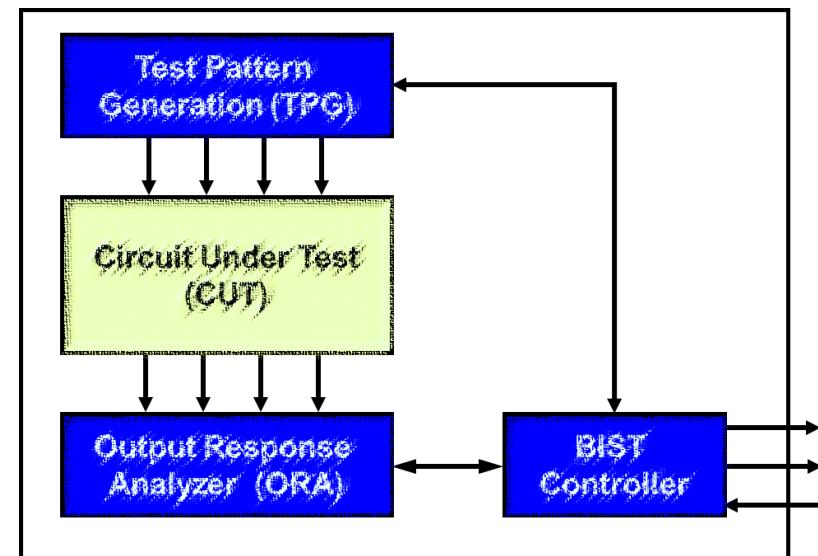

$$P(S, N) = \prod_{i=0}^{S-1} \frac{(2^N - 1) - (2^i - 1)}{(2^N - 1) - 1} \approx 1 - e^{-2^{(S-N)}}$$

- When  $N \geq (S+20)$ , probability not finding solution is  $10^{-6}$
- Example: scan chain length = 1,000. Assume 5% care bits
  - ◆  $S = 1000 \times 5\% = 50$ ;  $N = 50 + 20 = 70$
  - ◆ Primitive polynomial:  $f(x) = x^{70} + x^{16} + x^{15} + x + 1$

LFSR Degree  $N \geq (S + 20)$

# Summary

- What polynomial to use?
  - ◆ Primitive polynomials generates m-sequence
    - \*  $L_c=2^N-1$
    - \* Almost half one and half zero
    - \* Cyclic-shift-and-add property
- How to generate all-zero pattern?
  - ◆ Exhaustive feedback shift register
- How many degree  $N$ ?
  - ◆  $N \geq \text{care-bits} + 20$

# Pros and Cons of LFSR

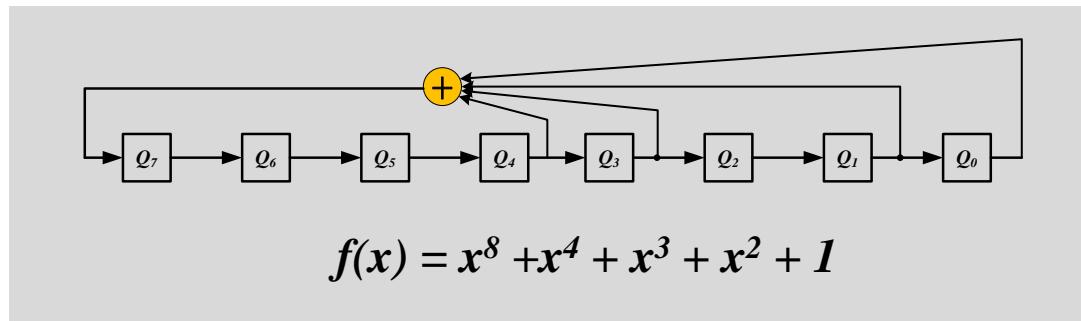

- Advantages

- Small area.
- Easy to design: PP → structure
- m-sequence has nice properties

- Disadvantages

- Not enough randomness
- Large LFSR has many tap points. too slow!

How to solve? see Cellular Automata

state	Q <sub>0</sub>	Q <sub>1</sub>	Q <sub>2</sub>	Q <sub>3</sub>
0	1	0	0	0
